# **Temu: analisi Android**

## Elementi importanti dell'analisi

- Coefficiente d'entropia dell'APK
- Warnings inerenti a possibili Phishing detections
- Profiling dell'utente collegato
- Gathering ed utilizzo del numero di telefono, associato all'account
- Accesso al microfono e telecamera al fine di effettuare registrazioni audio, screenshots e registrare video
- Accesso ai contatti del telefono per condividere l'applicazione
- Cronologia di browsing nell'applicazione e ricerche effettuate
- Richieste HTTP sospette verso due indirizzi IP identificati contenenti diversi attributi e parametri ottenuti
- Configurazione per i parametri delle richieste HTTP
- Ottenimento del device ID ed informazioni del telefono

Conclusioni.....	50

# Introduzione

Temu è una nuova applicazione di e-commerce, disponibile per Windows, Android e iOS, che permette l'acquisto di svariati prodotti a prezzi molto bassi. Diverse preoccupazioni e timori per la sicurezza dei dati e la privacy degli utenti sono emerse dopo la pubblicazione dell'analisi redatta da GlizzlyReports al seguente link: [We believe PDD is a Dying Fraudulent Company and its Shopping App TEMU is Cleverly Hidden Spyware that Poses an Urgent Security Threat to U.S. National Interests – Grizzly Research LLC \(grizzlyreports.com\)](https://grizzlyreports.com)

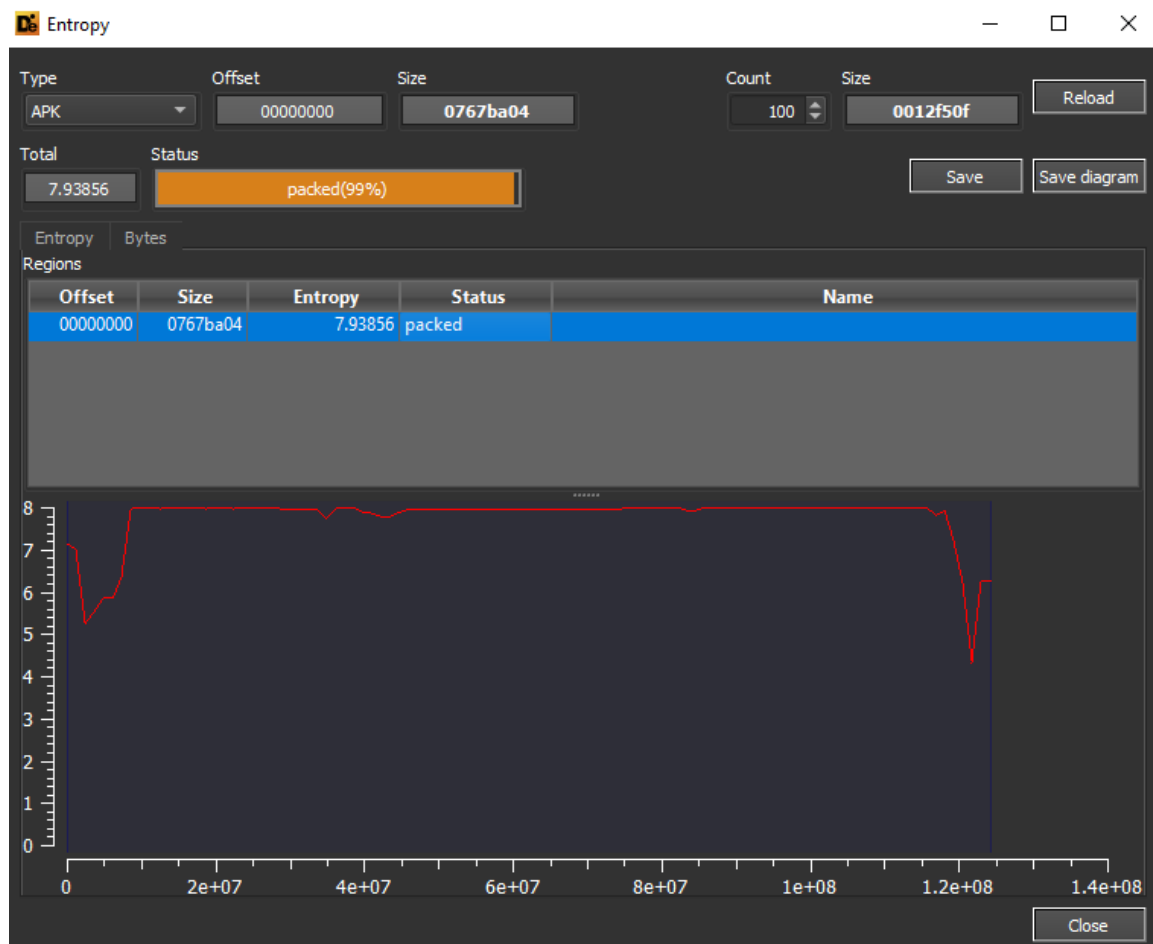

## APK assessment

Nella presente analisi è stato preso in considerazione l'archivio APK (versione 2.9.1) con hash **8601e8ec7dc523f02df8bd52a4ac22e3**.

```
File name: C:/Users/IEUser/Desktop/Temu_Shop Like a Billionaire_2.9.1_Apkpure.apk
Size: 124238340 (118.48 MB)
MD5: 8601e8ec7dc523f02df8bd52a4ac22e3
SHA1: 67b753415f78360aed23d6ef4dcd620ab01417f3
Entropy: 7.93856 (packed)
```

L'archivio possiede un alto coefficiente d'entropia che indica una situazione di packing ed obfuscation.

Effettuando una disamina del codice esadecimale dell'applicazione è possibile notare riferimenti al pacchetto *baogong*, contenente diversi metodi di gestione dei pagamenti, shopping carts enumerations ma anche metodi di hardware information gathering e permessi piuttosto invasivi ma necessari per alcune features di Temu.

Hex 073fee86 073fee82 25

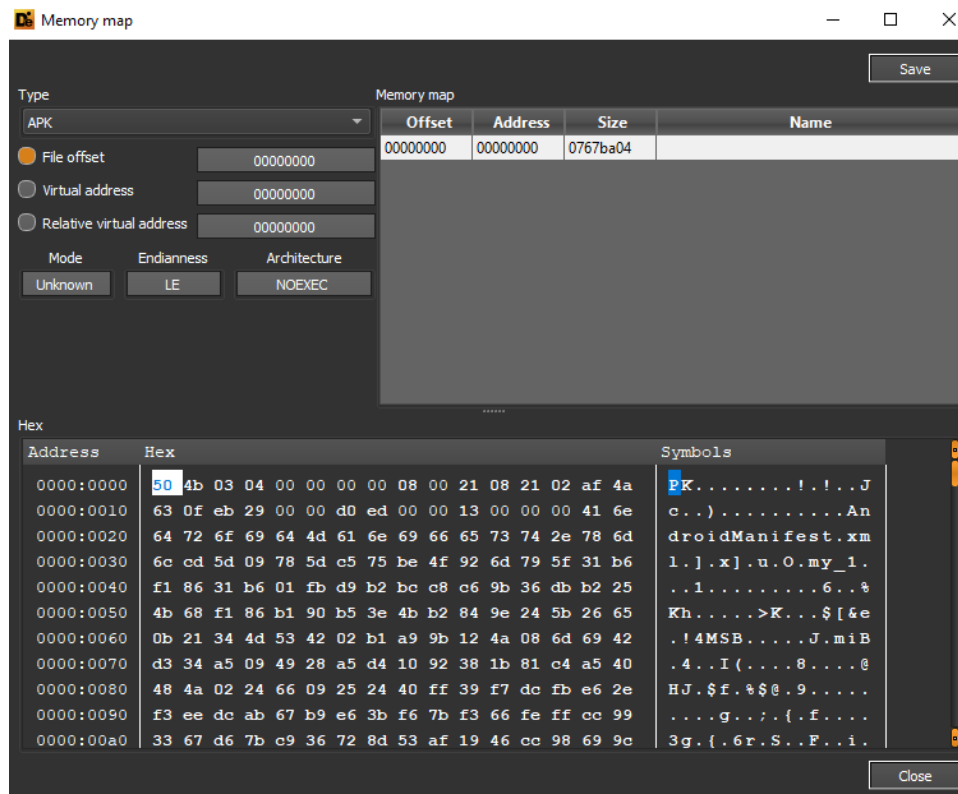

A seguire la distribuzione di bytes dell'APK, nella quale si evince una fase di *byte shuffling* nella regione alta:

Showing 131072 bytes starting at offset 00000000.

---

A seguire i dettagli della mappatura di memoria dell'archivio APK, ove si evidenzia l'header del file PK, identificante dei files di tipo archivio.

All'interno del dumping esadecimale della sezione possiamo notare il riferimento a stringhe in lingua tedesca e al package *app\_baogong* che permette di gestire nel caso specifico le settings del UI model XML.

Temu utilizza diversi moduli di tipo *Calendar* ed attributi per i patterns di *DateTime* e *dayNames*, pertanto a seconda della nazionalità del dispositivo sul quale è stata installata l'applicazione, vengono utilizzati diversi approcci di gestione delle date e dei giorni della settimana.

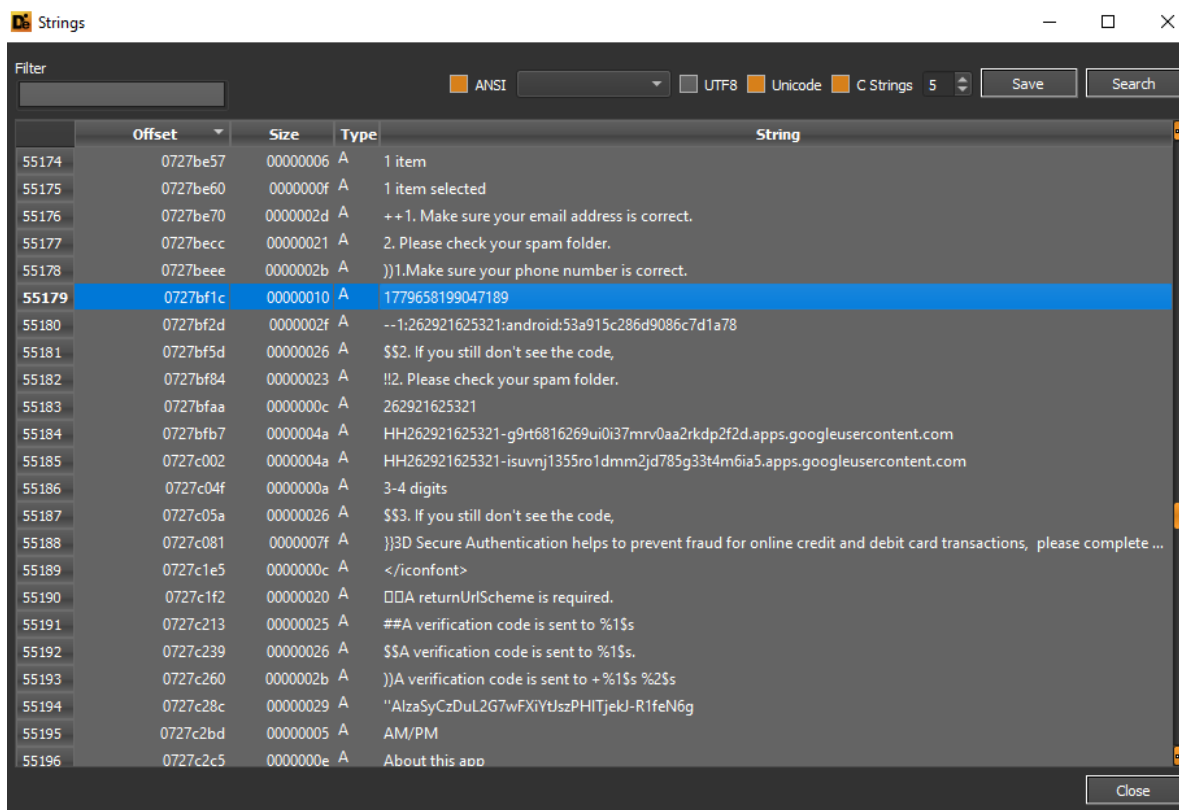

Di seguito alcuni riferimenti a stringhe in cirillico per la selezione multilanguage:

    } catch (NoSuchFieldError unused7) {  
    }  
    try {  
95      f49a[PaymentEventType.ON_CHOOSE_PAY.ordinal()] = 8;  
    } catch (NoSuchFieldError unused8) {  
    }  
    try {  
107     f49a[PaymentEventType.ON_SWITCH_PAYMENT_SIGN.ordinal()] = 9;  
    } catch (NoSuchFieldError unused9) {  
    }  
    try {  
119     f49a[PaymentEventType.SHOW_PAYMENT_ACCOUNT_DIALOG.ordinal()] = 10;
```

Il metodo *toString* è di tipo *String* e provvede a creare un oggetto *StringBuffer*, il quale contiene diversi dettagli degli attributi di headers, connessioni e body:

```
@NonNull
public String toString() {
    5     StringBuffer stringBuffer = new StringBuffer("FastWebDetailModel{");
    10     stringBuffer.append("call_start_ts=");
    15     stringBuffer.append(this.f84a);
    20     stringBuffer.append(", dns_end_ts=");
    25     stringBuffer.append(this.f85b);
    30     stringBuffer.append(", dns_start_ts=");
    35     stringBuffer.append(this.f86c);
    40     stringBuffer.append(", request_body_end_ts=");
    45     stringBuffer.append(this.f87d);
    50     stringBuffer.append(", request_body_start_ts=");
    55     stringBuffer.append(this.f88e);
    60     stringBuffer.append(", request_headers_end_ts=");
    65     stringBuffer.append(this.f89f);
    70     stringBuffer.append(", request_headers_start_ts=");
    75     stringBuffer.append(this.f90g);
    80     stringBuffer.append(", response_body_end_ts=");
    85     stringBuffer.append(this.f91h);
    90     stringBuffer.append(", response_body_start_ts=");
    95     stringBuffer.append(this.f92i);
    100    stringBuffer.append(", response_headers_end_ts=");
    105    stringBuffer.append(this.f93j);
    110    stringBuffer.append(", response_headers_start_ts=");
    115    stringBuffer.append(this.f94k);
    120    stringBuffer.append(", secure_connect_end_ts=");
    125    stringBuffer.append(this.f95l);
    130    stringBuffer.append(", secure_connect_start_ts=");
    135    stringBuffer.append(this.f96m);
    140    stringBuffer.append(", connect_end_Ts=");
    145    stringBuffer.append(this.f97n);
    150    stringBuffer.append(", connect_start_ts=");
    155    stringBuffer.append(this.f98o);
    160    stringBuffer.append(", connect fail ts=");
}
```

Qui alcuni attributi facenti riferimento a condizioni booleane, ad esempio il controllo della presenza di callback requests:

```
205     stringBuffer.append(this.f103t);
210     stringBuffer.append(", process_alive=");
215     stringBuffer.append(this.f104u);
220     stringBuffer.append(", pquic_errorcode=");
225     stringBuffer.append(this.f105v);
230     stringBuffer.append(", pass_through_fileds=");
235     stringBuffer.append(this.f106w);
240     stringBuffer.append(", pass_through_values=");
245     stringBuffer.append(this.f107x);
250     stringBuffer.append(", code=");
255     stringBuffer.append(this.f108y);
260     stringBuffer.append(", error_msg='");
265     stringBuffer.append(this.f109z);
270     stringBuffer.append('\ ');
275     stringBuffer.append(", has_dns_process=");
280     stringBuffer.append(this.f76A);
285     stringBuffer.append(", scheme='");
290     stringBuffer.append(this.f77B);
293     stringBuffer.append('\ ');
298     stringBuffer.append(", host='");
303     stringBuffer.append(this.f78C);
306     stringBuffer.append('\ ');
311     stringBuffer.append(", path='");
316     stringBuffer.append(this.f79D);
319     stringBuffer.append('\ ');
324     stringBuffer.append(", is_valid_report=");
329     stringBuffer.append(this.f80E);
334     stringBuffer.append(", is_backup_retry_request=");
339     stringBuffer.append(this.f81F);
344     stringBuffer.append(", has_callback_this_request=");
349     stringBuffer.append(this.f82G);
354     stringBuffer.append(", backup_retry_start_ts=");
359     stringBuffer.append(this.f83H);
364     stringBuffer.append('}');
367     return stringBuffer.toString();
    }
}
```

Qui la fase di costruzione della struttura dei parametri componenti l'oggetto *billingAddressModel* per la fase di pagamento e checkout con carta di credito.

```

});
}
}
}

```

Qui il metodo di conversione in stringa di oggetti *CMDDataEntity*, contenente diversi parametri, tra cui text e timestamp di salvataggio:

```

62 @NonNull
63 public String toString() {
64     return "CMDataEntity[label='" + this.f204a + "', text='" + this.f205b + "', saveTimestamp=" + this.
65 }
66
67 public C0092a(String str, String str2, long j, long j2, boolean z) {
68     this.f204a = str;
69     this.f205b = str2;
70     this.f206c = j;
71     this.f207d = j2;
72     this.f208e = z;
73 }
74 }

```

```

62
63
64 ", saveTimestamp=" + this.f206c + ", queryTimestamp=" + this.f207d + ", coerceToText=" + this.f208e + '>';
65
66
67
68

```

Di seguito un riferimento al contenuto della clipboard richiamato in fase di esecuzione del metodo `C262781.m18517e`:

```

1   public C0097f() {
2       this.f223d = null;
3       this.f220a = new C14927a();
4       this.f221b = C262781.m18517e(TeStoreModule.Tool, "clipboard").m18516f(1).m18521a();
5       this.f222c = Pattern.compile("^([268]):/.$");
6   }

```

La classe `C0106a` contiene numerosi riferimenti alle carte di credito registrate e viene effettuata un'enumerazione delle stesse; infatti nel caso in cui l'oggetto `card_content_list` sia diverso da null viene richiamato il metodo `card_content_list.m47839d` e viene salvato il risultato della chiamata a funzione all'interno della variabile `C14414h`:

```

Tra i servizi eseguiti possiamo notare connettività e storage. Essa fa uso dei moduli *androidxx.JizhanHelper* e *androidxx.MdfyHelper*. Tra i metodi richiamati vi è evidenza dell'ottenimento della tipologia di connessioni in vigore a bordo del dispositivo mediante la funzione booleana *android.net.NetworkCapabilities.hasTransport*:

java.util.ArrayList.readObject
java.util.ArrayList.readObjectNoData
java.util.ArrayList.writeObject
java.util.HashMap.readObject
java.util.HashMap.readObjectNoData
java.util.HashMap.readResolve
java.util.HashMap.writeObject
java.util.HashMap.writeReplace
java.util.LinkedHashMap.readObject
java.util.LinkedHashMap.readObjectNoData
java.util.LinkedHashMap.readResolve
java.util.LinkedHashMap.writeObject
java.util.LinkedHashMap.writeReplace
k4.z.onReceive
la.a.onReceive
ni0.b.onReceive
sun.misc.Unsafe.allocateInstance
```

Il package `t21` contiene il metodo di tipo String `f`, il quale ritorna diversi attributi di configurazione del DNS e vengono gestite le richieste HTTP verso gli indirizzi IP **20.15.0.[56** e **20.15.0.[9]**:

```

package t21;

import android.app.XmgActivityThread;
import android.text.TextUtils;
import android.util.Pair;
import androidx.annotation.NonNull;
import androidx.annotation.Nullable;
import com.einnovation.whaleco.lego.m2.impl.v8.event.Extras;
import java.util.ArrayList;
import java.util.List;
import n21.f;
import xmg.mobilebase.basiccomponent.titan.Titan;
import xmg.mobilebase.basiccomponent.titan.jni.DataStructure.StHostResolveResult;
import xmg.mobilebase.basiccomponent.titan.nova.NovaWrapper;
import xmg.mobilebase.nova.dns.HttpDns;
import xmg.mobilebase.nova.dns.g;

/* compiled from: Temu */
/* Loaded from: classes5.dex */
public class a implements g {
    @Override // xmg.mobilebase.nova.dns.g
    public String a() {
1       String a12 = e1.a.a();
5         if (a12 == null) {
8             return Extras.ALLOWED_CHARS;
        }
26        return a12;
    }

    @Override // xmg.mobilebase.nova.dns.g
5     public boolean b(@NonNull String str) {
        return ha1.a.v().b(str);
    }
}

```

Il metodo *h* ritorna un oggetto di tipo *ArrayList* di stringhe contenente l'indirizzo IP 20.15.0[.]9:

```

public void e(@NonNull String str, boolean z12) {
5     xa1.a.d().h(str, z12);
}

@Override // xmg.mobilebase.nova.dns.g
1     public String f() {
    return "{\n  \"preReadyDnsConfigItems\":{\n    \"locale.temu.com\":{\n      \"vaildTimeFromProcAlive\"
    }
  }
}";
}

@Override // xmg.mobilebase.nova.dns.g
6     public int g(String str, String str2) {
5     if (TextUtils.isEmpty(str) || TextUtils.isEmpty(str2) || !str.endsWith(".matk.temu.com") || !TextU
    return 0;
31    return 2;
}

@Override // xmg.mobilebase.nova.dns.g
1     public long getProcessAliveDuration() {
    return mc.c.a();
}

@Override // xmg.mobilebase.nova.dns.g
3     @NonNull
    public List<String> h() {
8     ArrayList arrayList = new ArrayList();
26    arrayList.add("20.15.0.9");
    return arrayList;
}

@Override // xmg.mobilebase.nova.dns.g
5     public boolean i() {
    return f.o(XmgActivityThread.currentApplication());
}

```

Con un'analisi DTI dei domini **us[.]thtk[.]temu[.]com** e **us[.]temu[.]com**, utilizzati mediante le richieste HTTP attraverso l'indirizzo IP **20.15.0[.]56**, è possibile evidenziare i seguenti dettagli relativi alle porte aperte **80** e **443**. I dettagli includono gli attributi **api\_uid**, indispensabili per le richieste HTTP e HTTPS:

```

Vengono ottenuti in modo serializzato alcuni attributi individualizzanti del telefono sul quale viene installata Temu, quali ad esempio `tel_location_id` ed `email_id`:

```
import androidx.annotation.NonNull;
import androidx.annotation.Nullable;
import androidx.core.app.NotificationCompat;
import com.einnovation.whaleco.lego.m2.impl.v8.event.Extras;
import com.google.gson.annotations.SerializedName;

/* compiled from: Temu */
/* loaded from: classes2.dex */
public class f {
    @NonNull

    /* renamed from: a reason: collision with root package name */
    public String f380a;
    @SerializedName("last_sent_yzm_time")

    /* renamed from: b reason: collision with root package name */
    private long f381b;
    @Nullable
    @SerializedName("tel_location_id")

    /* renamed from: c reason: collision with root package name */
    private String f382c;
    @Nullable
    @SerializedName("mobile")

    /* renamed from: d reason: collision with root package name */
    private String f383d;
    @Nullable
    @SerializedName(NotificationCompat.CATEGORY_EMAIL)

    /* renamed from: e reason: collision with root package name */
    private String f384e;
    @Nullable
    @SerializedName("email_id")

    /* renamed from: f reason: collision with root package name */

```

All'interno della classe `z1` possiamo notare il metodo di tipo `Object a` (che andrà poi ad implementare il medesimo all'interno della classe `c1`), il quale ottiene il serial number associato all'utente con il getter `this.f60958a.getSerialNumberForUser(this.f60959b)`.

```
package pm0;

import android.os.UserHandle;
import android.os.UserManager;

/* compiled from: Temu */
/* loaded from: classes3.dex */
public final /* synthetic */ class z1 implements c1 {

    /* renamed from: a reason: collision with root package name */
    public final /* synthetic */ UserManager f60958a;

    /* renamed from: b reason: collision with root package name */
    public final /* synthetic */ UserHandle f60959b;

    public /* synthetic */ z1(UserManager userManager, UserHandle userHandle) {
4         this.f60958a = userManager;
6         this.f60959b = userHandle;
    }

    @Override // pm0.c1
    public final Object a() {
5         Long valueOf;
19         valueOf = Long.valueOf(this.f60958a.getSerialNumberForUser(this.f60959b));
        return valueOf;
    }
}
```

All'interno dell'oggetto *hashtable2* vengono aggiunti diversi attributi individualizzanti, quali ad esempio gli indirizzi di consegna, serial number, numero di telefono.

```
982     hashtable2.put("dc", G5);
987     hashtable2.put("description", G6);
992     hashtable2.put("destinationindicator", G7);
997     hashtable2.put("distinguishedname", G8);

```

## Conclusioni

---

Temu possiede numerose caratteristiche che, nonostante siano fisiologiche e coerenti con la categoria dell'applicazione stessa (e-shopping), presentano alcune criticità in relazione alla conformità alla privacy dei dati personali degli utenti. Questo è il motivo principale per cui Temu potrebbe essere considerata come un'applicazione potenzialmente indesiderata dagli utenti e, di conseguenza, tacciata come "sospetta" dai vari application stores.

Ciò che colpisce di Temu è il livello di profondità a cui accede nei dispositivi sui quali è installata anche per le proprie peculiarità di ottenimento di attributi identificativi, come ad esempio il device ID contestualmente all'invio di richieste HTTP individualizzanti. Secondo i termini e le condizioni di Temu, inoltre, nel caso in cui il metodo di pagamento di default salvato all'interno del proprio account non fosse disponibile, l'applicazione procederà a selezionare una seconda carta di credito (se impostata in precedenza all'interno dei metodi di pagamento).

Alla luce delle superiori evidenze, Temu potrebbe in definitiva essere indicato come "GreyWare" in quanto non propriamente identificabile come malware ma comunque in grado di influenzare la user experience, mostrando comportamenti non sempre trasparenti e non discutibili sul piano della conformità regolamentare della privacy.
